

Consistent and secure network connectivity is increasingly important for data dependent businesses. Even the most reliable of terrestrial networks are susceptible to outages caused by natural or man-made events. Wide-area network failures are responsible for approximately one-third of network downtime. Unfortunately, many businesses use backup connections that follow the same cable channels that their primary connections use and are therefore susceptible to the same forces that disrupt the primary networks. Furthermore, with existing backup terrestrial services, restoration of communication can take hours or even days.

RecoverSat® utilizes satellite technology to provide a truly superior alternative to terrestrial backup services.

About SDN Global

SDN Global, a member of SatCom Group, is an industry leader in fixed and mobile broadband VSAT connectivity for over 95% of the populated world. SDN Global's private connection to redundant teleports allows customers to connect to a full range of high-speed data, voice, and video transfer solutions. SDN Global's suite of products - BroadSat®, GenSat®, JobSat® and RecoverSat® - enables its users to communicate in remote areas or when terrestrial infrastructure is unreliable, cost-prohibitive or nonexistent. All SDN Global customers can rely on immediate and trusted support 24/7/365.

RecoverSat® Features:

True Path Diversity

Satellite technology connects directly to the customer's Local Area Network (LAN), and seamlessly transitions Wide Area Network (WAN) traffic in the event of a primary failure. This approach creates a "secondary gateway" for the remote users that is always on and ready to transport data via a truly diverse path from the primary route.

Always On

Service is always on "standby" and is configured to automatically and seamlessly switch over when the primary connection fails.

Broadband Internet Access

Satellite connection provides public or private connectivity.

VoIP Capability

Connection can be made to the public switched telephone network for local and long distance calls.

Versatile Set-up

Satellite equipment can be attached to fixed structures or mobile command centers.

24/7/365 Support

SDN's redundant NOC's are staffed with highly trained individuals on call all day, every day.

Cost Effective

Monthly fees are based upon the number of sites for which back up services are reserved. Customers have the option to deploy backup services to a few data critical sites or across the entire network.
